Adobe's Photoshop CC is an increasingly powerful image editing tool. But as you edit one image, it takes a while to move to the next. What good is a big toolbox if you have to open, close and load up the other tool all the time? Is there a way to speed up Photoshop and avoid opening multiple copies of a big image?

As you touch up a photo, you can add crop guides for editing an image - we call these stamp tools, and they're available in most image editing programs. But as you work, adjust, redo, touch up, your stamp tools get more and more cumbersome. You have to drag them around, or even redo and adjust perfectly similar region of the photo. Plus, there's just too many of them.

The way to work on various stages of a photo with the same stamp tools, is to use different stamp features. The image above uses stamp views for stamping a selection to Redraw, New Layer, New Layer Down, Merge Layers, and Add to Favorites. You can use the same stamp tool in these different ways to work on different stages of a photo. The stamp tool can also be applied to a whole selection, so you can stamp out areas of the photo just as you would in a browser.

One of the best uses for the new warp features in Photoshop is for adding flash to a subject even if it wasn't originally in the picture. Rather than complexly manipulating shapes (which you can do with the new (and awesome) Warp tool), you can just draw free-hand. And thanks to a small area of automatic warping, the flash tool can be used in fine detail, especially when it's aimed in close to an object like a branch, that has an unusual shape. If you end up damaging the original image in any way, the colors of the original will generally be preserved when you undo - though this could get trickier if your original image was shot in color.

You might also be interested in using the Hue & Saturation tool, which can be accessed from the Adjustments tab in the Channels panel. It allows you to adjust the mix of red, green, blue, and so on to match a single color in a picture. You can apply this tool to any color within a color swatch, or put a color from a picture or scanned document into a swatch.

There are other less powerful suites like GIMP and Corel, that also have some of the same or similar features to Adobe. They do not perform like full featured Photoshop, however. While there are some online tutorials, they are aimed at people who are just starting out, rather than experienced professionals. Blender and the Blender Foundation (www.blender.org) have been working for many years to reinvent how 3D computer-generated images are created, and are one of the most popular 3D software tools around. If you are (or would like to be) skilled at 3D creation, you should consider learning Blender. Ultimately, you can use Photoshop's native functions, and most of Photoshop's functions can be used together with the tools you see mentioned above and in this article. However, an automation wizard is much faster when you are doing more complex work. You can set up automations to perform repetitive tasks across your documents systematically and in a single shot. Some editors might prefer to work from a contact sheet or a master photo with all of the digital files from the photo shoot in raw format. This helps to keep each design job separate. You will be able to get the best from a contact sheet when you are finishing a job and working on all the associated files and the design can be scaled up or down at any time. However, you might find it opens up working on raw files, image selection, and color matching, when you need to pre-compose and create your designs. The biggest advantage is that you save a lot of computing resources and get consistent results.

If you're anything like me, you have a bunch of images saved up in your computer “forever' for your next project. And nothing ever really gets implemented from those huge banks of images. You might lose the mood you had when you originally shot it, or you're not sure what the people in it want, or you're not sure what it could be used for. There's nothing wrong with taking a few shots of a model, and saving them for future reference; but the problem becomes how you go about organizing those photos. Using a tool like Adobe Photoshop is one of the best ways to organize and save them. With its new feature, Find in Photoshop, you can search for a keyword in your images and save tens of thousands of photos at once! You'll want to save these brand new designs somewhere, and good friends have told you that Photoshop is the best option. Why? Because not only can you view these brand new phone screens right inside Photoshop, you can make your own design from scratch, and even save the details of the phone for later.
